

Through-wall radar

From *Cambridge Consultants*, Prism 200 is a handheld through-wall radar, designed to be used by police, special forces or emergency services. It provides quick and covert intelligence on the movement and location of people in a room or building — without the need for invasive sensors. Prism 200 has been designed for situations where a high degree of insight is essential for success. The compact, portable and durable product uses advanced signal processing to highlight moving people and objects in cluttered environments, through doors or brick, block and concrete walls. With the press of a button, operators can switch between front, plan or profile views for a complete picture. Users can also observe the scenario in a 3D view, where the perspective can be rotated to look at a room or building from various vantage points.

Handheld/mountable monocular

The *ATN 6015-WPT* monocular is based on ATN's PVS-14 system used by the U.S. Military. The ATN 6015-WPT can be handheld, head/helmet-mounted for hands-free usage, or can be adapted to be used with cameras or camcorders. The ATN 6015-WPT also features ATN's night vision innovation of White Phosphor Technology, in which the viewer sees a crisp black and white image instead of the traditional green glowing image. This technology allows for a clearer image with more detail and greater depth perception — critical elements for law enforcement and private security surveillance.

High res tactical thermal imaging

FLIR Systems' H-Series line of handheld law enforcement thermal imaging cameras features four times the resolution of other systems, and several powerful tactical features. H-Series thermal cameras let officers see things other technologies miss. Suspects can't hide their heat, so operators can see them clearly in total darkness, and through smoke and dust. Available with several industry-defining features, including

onboard video storage with real-time clock, wireless streaming video transmission, and a 20-day standby battery life. An optional lens extender allows officers to see a person from over 2,800 feet away.
